

CIS170 Project 8

In this project, you will create a listing of classes offered at Wibaux University. The files involved are shown below.

WATCH THE VIDEO THAT ACCOMPANIES THIS.

- This video mentions use of input and output specs, an older style of definition.
- It also displays and mentions some page number and chapter numbers that have shifted in the new edition, however, this sheet is using the correct references.
- ***You will NOT be writing input or output specs for your project.*** You will design your report using the RDi Report Designer.

There are TWO input files:

WUSCTP

***** Beginning of data *****

A* WIBAUX University Current Sections File

A			UNIQUE
A	R	SECREC	
A		SECTION	5S 0 TEXT('Section Number')
A		DEPT	3 TEXT('Course Department')
A		CRSNO	3S 0 TEXT('Course Number')
A		SECTIM	4S 0 TEXT('Meeting Time')
A		SECDAY	3 TEXT('Meeting Days')
A		ROOM	4 TEXT('Room')
A		CAP	3S 0 TEXT('Maximum Enroll.')
A		CURENL	3S 0 TEXT('Current Enroll.')
A		INSTNO	9S 0 TEXT('Instructor SSN')
A	K	SECTION	

WUCRSP

***** Beginning of data *****

A* WIBAUX University Course File

A			UNIQUE
A	R	CRSREC	
A		DEPT	3 TEXT('Course Department')
A		COURSE	3 TEXT('Course Number')
A		CRSTTL	25 TEXT('Course Title')
A		CREDIT	1S 0 TEXT('Credits')
A	K	DEPT	
A	K	COURSE	

Notes:

- Code in Free Form
- Design a report to contain the following items, using the RDi Report Designer, including:
 - An appropriate title for your report
 - The current date and your name
 - The page number, zero suppressed
 - Appropriate column headings and the detail line for:
 - Section number
 - Department
 - Course number
 - Course title
 - Credits
 - Time
 - Days
 - Room
- Also design an “error” line that will print if no match is found between the two files
- On the DCL-F statements, use “Keyed” so that your logic is utilizing the keys
- Program Logic:
 - Be sure to allow for page overflow; when one page is filled, your report should break to another page, print the headings again, and continue on.
 - Read the Sections file (WUSCTP) sequentially as you would normally read your main input file; priming read, dowhile loop, end of file, etc.
 - Inside your loop, randomly access (CHAIN) to the Course file (WUCRSP) using your concatenated key to extract the Course Title and Credit data from it.
 - NOTE: note that in the DDS external descriptions, in the WUCRSP data definitions, both the course number and department are defined alphamerically, however, in the WUSCTP file, the course number is defined numerically. In order to be able to concatenate a key, you will need to deal that issue (how do we convert numeric data to character data? See your “Processing Character Data” chapter)
 - If a match is found, print a “good” detail line
 - If a match is not found print an “error” detail line

Email your instructor when your project is ready for evaluation.
