

CIS170 Project 9 (75 points)

1. View this short video. The presenter is Susan Gantner, a highly renowned IBM i trainer. Note that some of the RPG code you will see is fixed format, however, focus on the RDi Screen Designer tips.

[Click here for Youtube Video](#)

2. View the “Interactive Inquiry” video (found next in the Project 9 Blackboard folder) with this handout in front of you.
3. INQSCREEN is a DDS source member that has been placed in your QDDSSRC file. The first screen has already been designed to follow this layout:

	10	20	30	40	50	60	70	80
1	Program ID: 000000000		CloudServices24x7, Inc.			MM/DD/YY		
2			Product Supplier Inquiry

--- Continued on Next Page ---

- Use the RDi Screen Designer to add the missing elements as described in the video so that your SCR2 screen matches the layout shown below. Note that we will display USER ID in the upper left corner rather than Program ID.

.....10.....20.....30.....40.....50.....60.....70.....80	
Program ID: 000000000	CloudServices24x7, Inc.
	MM/DD/YY
Supplier Information	
Supplier code	000
Name.	00000000000000000000000000000000
Contact person	00000000000000000000000000000000
Street	00000000000000000000000000000000
City	00000000000000000000000000000000
State	00
Zip	66666-6666
Phone	666 666-6666
Press Enter to continue.	
F3=Exit	

- Before moving on, review the DDS code for INQSCREEN:

NOTE the following elements that are important to your RPG program:

PRODIN.... The name of the input field from SCR1, the first screen

CA03 Means that Indicator 03, known as *IN03 in your RPG program, will be ON (*ON) if the user presses function key F3

90 The “bad product” indicator that is conditioning the ERRMSG message “Invalid product number” for the first screen (called SCR1)

95.....The “bad supplier” indicator that is conditioning the ERRMSG message “Supplier not found” for the second screen (called SCR2) Update this message to “Product Number valid, but Supplier Code not found” in the DDS code

- Save your source to the host. Compile. Anything more than level 10 in the error list will need fixing.

---- Continued on next page ----

7. Create the RPG Program to interact with your INQSCREEN. See the Chapter 12 and the PowerPoint for information on how to define a screen definition as your file, how to define the indicators, and how to code calculation specs to interact with the screens.

Inside the loop, insert logic for the following:

Use the input field from SCRN1 (PRODIN) to randomly retrieve the corresponding record from the CSINVP file (CHAIN – you learned how to do this in your Project 7)

If the CSINVP chain is good:

use the supplier code to chain to the CSSUPP file –

if the CSSUPP chain is not good, turn on the “bad supplier” indicator and display the first screen (SCRN1) which will show the error

if the CSSUPP chain was good, display the second screen (SCRN2) to show the retrieved data

If the CSINVP chain is not good, turn on the “bad product” indicator so that when the SCRN1 is redisplayed a message will be displayed to alert the user.

4. Test your program with good and bad product numbers. 117711 and 130102 are good product numbers. 110110 has a good product number, but has a bad supplier code. Be sure that F3 works.

Project Submission:

1. Screen capture your entire window with the Screen Designer showing SCRN2
2. Email this screen capture to your instructor when your project is ready to be evaluated.
