

CIS170 Project #2

1. Review Section 3.11 “Externally Described Printer Files” in the text and the corresponding slides in the Powerpoint.
2. Watch the demonstration video.
3. Browse through the INVREPORT printer file, found in your QDDSSRC file, which was used for Project 1. Note that it uses an alternative method for referencing fields in an external database file. Compare that method to that which was presented in the video. Both are valid methods.
4. You might want to have some blank DDS forms to work with while doing this project. They are available in the unit just above this item.
5. Print a “printchart” form for use.

Input: Your input file is GTCSTP. Use `RUNQRY QRYFILE ( (GTCSTP) )` to examine its data.

***** Beginning of data *****

A* GTC - Customer Master File

A			UNIQUE
A	R CUSREC		
A	CPHONE	10S 0	TEXT('Customer phone')
A	CLNAME	15	TEXT('Last name')
A	CFNAME	10	TEXT('First name')
A	CSTRET	20	TEXT('Street address')
A	CCITY	15	TEXT('City')
A	CSTAT	2	TEXT('State')
A	CZIP	5S 0	TEXT('Zip')
A	CURBIL	6S 2	TEXT('Current bill amt.')
A	AMTOWE	6S 2	TEXT('Total amount owed')
A	PAYDAT	8S	TEXT('Last payment date')
A	PAYDATL	L	TEXT('Last payment date')
A	K CPHONE		

6. Design a printchart to plan the layout of report that meets these requirements:
 - a. The report should contain a heading titled `GTC Customer Accounts`. This same heading should contain a page number and the current date.
 - b. Plan to print only these items: `CPHONE`, `CLNAME`, `CURBIL`, and `AMTOWE`.
 - c. The report should contain appropriate column headings for these four fields.
 - d. The report should have detail line that will list the data for these fields.
 - i. The `CPHONE` data must be shown with editing. For example (555)123-4567 (see `EDTWRD`)
 - ii. The `CLNAME` data will be shown as is.
 - iii. The `CURBIL` should be edited so that it would print a zero balance, contain commas, and print with a trailing negative sign if negative (see `EDTCDE`)
 - iv. The `AMTOWE` should be edited in the same way, but is also to include a floating dollar sign.

--- continued on next page ---

7. Using your printchart, code the DDS for your report. (You might want to do this on the paper forms first, your choice) Place it in your QDDSSRC

STRPDM

Choose "3" for Work with Members

Fill in QDDSSRC for file, your library name (same as user id) for Library

Once at "Work with Members Screen Using PDM":

You may key this from scratch or you may use option 3 on the Work with Members Using PDM screen to create a copy of INVREPORT and make changes to it.

Or, to create from scratch, use F6 for create, the "source type" will be PRTF

8. Achieve a clean compile. Debug in the same manner (split screen) as you did for Project 1.
9. Go into your QRPGLSRC file and copy your PROJECT1 code into PROJECT2. (option 3)
10. Edit PROJECT2 code appropriately to use GTCSTP as the input file and your new printer file as the output file.
11. Compile the RPG program and run it. Examine your results. Adjust the printer file and/or RPG program as necessary to achieve the desired results.
12. Email your instructor when your project is ready to be viewed.
