

CIS170 Project #3

Wibaux University wants a program to generate a payroll register for its hourly employees.

The file contains information about regular and overtime hours worked and pay rate for hourly employees, and has been externally defined as WUHRLYP:

A* Wibaux University Hourly Employee File

A			UNIQUE
A	R EMPREC		
A	EMPNO	9S 0	TEXT('Employee SSN')
A	LNAME	15	TEXT('Last Name')
A	FNAME	10	TEXT('First Name')
A	REGHRS	3S 1	TEXT('Regular Hours')
A	OTHRS	3S 1	TEXT('Overtime Hours')
A	RATE	4S 2	TEXT('Hourly Pay Rate')
A	PAYCODE	1	TEXT('Pay Code')
A	K EMPNO		

Notes about the calculations:

- The school pays time and a half for overtime hours.
- Gross pay is the sum of regular and overtime pay.
- Federal tax withheld is 18 percent, state tax is 5 percent, and FICA is 7.51 percent.
- Define these percentages as Named Constants
- Net pay is gross pay less deductions for taxes and FICA.
- Be sure to incorporate rounding where appropriate.

Notes about the printchart:

- Your report should meet the specification shown on the printchart on the next page.
 - Be sure to review the document *Calculated fields in External Printer Definition* in the unit.
- Only the initial of the first name is to be printed as part of each employee's name.
- Pay attention the editing that should occur according to the printchart.
- In addition to the heading lines and detail line, there is also a "total line." This total line contains accumulated values and should only be printed once, at the end of your program (just before you turn on *INLR)
 - Be sure to review the document *Timing of calculations and printing* in the unit.
- The page number is zero-suppressed this time.
- Remember to view your output via the IBM Access Client Solution's *Printer Output* feature as well as viewing in green screen.

This project will require you to use techniques that are found not just in this chapter, but in previous chapter materials as well.
