

CIS170 Project 4

This project requires the use of the RDi integrated development environment that should be installed at this point.

Note that the three separate parts of this project are NOT related to one another.

You should also have watched these videos:

- Using RDi for RPG Coding, Compiling, and Calling Batch Applications
- Using RDi for DDS
- Using RDi Report Designer

PART A: Using RDi for RPG Development

Your task is to use RDi to correct several errors in a program that is being provided to you and provide proof that you did this using RDi.

Overview of the program being provided for this project:

CloudServices24x7, the mail-order company, extends financing to some of its preferred customers. All financing is done for 12 months at a fixed rate of 14 percent. The company charges interest on the total amount financed, rather than on the unpaid balance remaining after each successive payment. Accordingly, the monthly payment is determined by calculating the interest due on the unpaid balance, adding the interest to the unpaid balance and dividing that sum by 12. The purchase date is to be printed using the format *dd-mm*, and the report requires a count of customers in the file.

This program for CloudServices24x7 calculates monthly charges for each customer, accumulates some totals and a customer count.

Input: CSCFINP

```
                UNIQUE
R FINREC
  FINNO          6S 0    COLHDG('Finance Number')
  CUSTNO          6S 0    COLHDG('Customer Number')
  FINAMT          7S 2    COLHDG('Finance Amount')
  DWNPAY          7S 2    COLHDG('Down Payment')
  CDATE           8S 0    COLHDG('Commencement Date')
  REMIT            1      COLHDG('Remittance Period')
  TERM            3S 0    COLHDG('Term - Months')
  BALDUE          7S 2    COLHDG('Balance Due')
K FINNO
```

Report: Already created and in your library

Untitled / TOTAL					
CloudServices24x7, Inc.					
Customer Balance and Payment Report					
MM/DD/YY	Purchase Amount	Purchase Date	Down Payment	Balance Owed	Monthly Payment
666660	66666.66	66-66	66,666.66	66,666.66	6,666.66
Totals			\$666,666.66	\$666,666.66	\$666,666.66
Number of customers processed 666					

Your Tasks – read this all the way through before starting.

1. In your QDDSSRC file, you will find the external printer file definition FINREPORT. Go find it in the usual green screen manner and compile it.
2. Next, use the RDi software to locate PROJECT4A in your QRPGLSRC file and open it for editing. Note that you will need to watch the video *Using RDi for RPG Coding, Compiling, and Calling Batch Applications* in the Project 4 folder in this unit first.
3. Using the features and techniques demonstrated in the video, compile and correct the program. To show that you did this, provide the following in a word processing document:
 - a. **Provide 2 screen captures** during the process showing that you are using the compiler in RDi. (Screen capture: you can use the Windows Snipping Tool, your “Print Screen” key on your keyboard or another method you might already be using, and then paste the image into your word processing document)
 - b. Call your program from within RDi as demonstrated in the video.
 - c. **Provide a screen capture** showing the resulting spooled file report (in image form) as demonstrated in the video.
 - d. Submit the word processing document in Blackboard, in the **PROJECT 4-PART A** link.

PART B: Using RDi for DDS

Your Tasks – read this all the way through before starting.

1. Use the RDi software to locate PROJECT4B in your QDDSSRC file and open it for editing. Note that you will need to watch the video *Using RDi for DDS* in the Project 4 folder in this unit first.
2. Using RDi, debug this until you achieve a clean compile:
 - a. Start a word processing document and **provide 2 screen captures** during the process showing that you using the compiler in RDi.
 - b. Provide a **third capture showing a clean compile** in RDi.
 - c. Submit the word processing document in Blackboard, in the **PROJECT4-PARTB** link.

PART C: Using RDi Report Designer

1. Use Report Designer to create a report based on the information below. Note that you will need to watch the video *Using RDi Report Designer* in the Project 4 folder in this unit first. You will only be practicing the use of the Report Designer, you will not be required to write an accompanying RPG program for this part.

The file that will be used is ACP001, which has been previously defined: (note those are zeroes in the name)

```
A* Physical file ACP001 representing ACME Work File
A          R ACMEREC
A          SOCSEC          9S 0          TEXT('Social Sec. Number')
A          NAME            16          TEXT('NAME')
A          WKDATE          8S          TEXT('Date Worked')
A          WKHOURS         4S 2          TEXT('Hours Worked')
A          QTY             3S 0          TEXT('Quantity Produced')
A          K SOCSEC
```

2. Using the RDi Report Designer, design a report that meets these specifications:
 - a. Headings
 - i. A title for the report
 - ii. Current date
 - iii. Page number
 - iv. Column headings for the items in the detail line
 - b. Detail
 - i. Social security number, edited with dashes
 - ii. Name
 - iii. Hours worked
 - iv. A field called Pay, that will be a calculated field based on minimum wage (that logic would be in the RPG program which you are NOT required to write for this part of the project)
3. In a word processing document, provide screen captures showing:
 - a. The RDi Report Designer open in “Design” view.
 - b. A clean compile of the DDS code in “Source” view.
 - c. Submit the word processing document in Blackboard, in the **PROJECT4-PARTC link**.
