Assignment Instructions

Change the name of your Chapter 04 folder to Chapter04 in the VS Code editor project. You should be able to do this by right clicking in Windows and selecting rename.

The reason for this is that VS Code will upload this folder to your web server once you save and upload the file you are creating in this assignment. The standard for URLs is that they should not includes spaces (https://www.sistrix.com/ask-sistrix/technical-seo/site-structure/do-i-have-to-convert-the-spaces-in-urls). While it is possible to deal with spaces in URLs it is best to simply avoid them when you can. By changing the folder name to Chapter04 instead of Chapter 04 it solves this issue.

Going forward in the class, you should always remove spaces from file and folder names.

You can get a head start and rename all of your VS Code folders (workspace/projects) now to eliminate the space or you can change them as you use them.

- Create a new blank file in your newly named Chapter04 folder called *week2project2.html*
- Paste the starter code found in the Week 2 file Zookeeper Form Revised For Use In Project Two for Week Two below.
- Edit the form to include the following features:
- The phone number field should ONLY accept 10 numbers (no more . . . no less . . . and no other characters) upon submission.
- See *patterns* and *Validating with Regular Expressions* on pages 116 and 117.
- The name, phone number and email fields should all have useful placeholders to guide user input
- See *Adding Hints with Placeholders* on pages 109 - 111
- Make the Telephone field required

- See *Validation* on pages 112 - 116
- Change the Age field so the increment selection is in one year increments instead of 1/10 of a year increments.
- See *step* under *Numbers* on pages 126 and 127
- Change the title tags and other text on the page to make it the form appropriate for volunteer recruitment at some other type of organization of your choice (ie an Elementary School Classroom Volunteer Application, A Library Volunteer, A Hospital Volunteer, etc.) Be sure to change the checkbox options so they no longer include *your favorite animals* but something else more appropriate to the type of organization you selected.

When completed, this file should be uploaded to the server using the FTP functionality in VS Code (with the plugin you implemented last week).

It should end up residing in your space on the student server in a location that would look something like this https://000.000.000.000/~username/Chapter04/week2project2.html. Your actual URL may vary.

Be sure you validate your code on the W3C validator and correct any errors. You do NOT need to correct warnings, but do be aware of warnings and correct any errors. If you have questions about how to use the validator and how to correct errors, please contact me.

This assignment is worth 25 points. Once you have completed this portion of the assignment, submit the URL here.
