Project #5 Instructions
Chris Grimm
10/22/26

Assignment Instructions

Before You Begin

Do not begin this project until you have completed this week's textbook reading and reviewed the related course materials.

Most weeks, you will complete two hands-on projects, Part 1 and Part 2. This week, you will complete one larger project worth the full 50 points. There is no Part 2 project this week.

Each project is important because the skills you develop will build from one week to the next.

Points and Due Date

Points: 50

Due: Next Wednesday by 11:59 p.m.

Project Instructions

For this week's project, add the following features to your homework home page:

1. Create Two Columns

Create at least two columns of content using a fluid design with percentage-based widths. Refer to pages 222–223 of the textbook.

You may use the sample code provided in the textbook. Your columns do not need to contain actual content, so you may use filler text if needed.

The columns must have different widths. Do not use a 50%/50% split. For example, the textbook uses widths of 28.6% and 71.4%.

2. Add Column Margins

Adjust your columns to include appropriate percentage-based margins. Refer to pages 223–225, especially the sample code near the top of page 225.

3. Use EM or REM Text Sizes

Convert all text sizes to either EM or REM units. Your page must include at least three different text sizes. Refer to pages 228–230.

4. Change the Column Background Colors

Create a media query that changes the background color of both columns when the screen width is 384 pixels or smaller.

Page 235 provides sample code using a width of 480 pixels. Adapt that example so it applies at 384 pixels.

5. Stack the Columns on Smaller Screens

Use a media query to stack one column below the other when the screen width is 384 pixels or smaller. This will require removing the float from the columns.

Refer to the sample code on page 238. You may add this rule to the media query created in Step 4 or create a separate media query.

Submitting Your Project

When you have completed and tested your project, submit the URL to your project on the student server using the Blackboard submission link provided.
