Assignment Instructions

Week 7 Project, Part 2: Customize Canvas Paint Program

Before You Begin

Complete this week's reading and review the related materials. Use the paint program in your publisher-provided files, discussed on pages 263–270, as your starting point.

Read through the code before making changes. Look for the instructions that control paint colors and pen thickness. This project is as much about troubleshooting and understanding existing code as it is about drawing with canvas.

1. Change the Paint Colors

Replace the program's three paint colors with three new colors that are not among the original choices.

Each color selection must produce its new color when you draw. You do not need to change the interface icons, although you may update them if you wish.

2. Change the Pen Thickness Options

Update all three pen thickness choices.

Each choice must use a different thickness from its original setting. Keep the three options distinct so someone using the program can clearly see the difference.

3. Upload and Test Your Program

Create a folder named paint directly inside your home directory on the student server. Upload your modified program and all supporting files into that folder.

Open the published program in your browser and check that:

- **Each color selection produces the correct new paint color.**
- **All three pen thickness options work and are visibly different.**

- **The program's other controls still function.**
- **All required files load correctly.**

Make one change at a time and test as you go. If something stops working, this will make it easier to identify the cause.

Submit Your Project

Submit the following through this assignment in Blackboard:

1. **The URL to your modified paint program on the student server.**
2. **A note identifying your three new colors.**
3. **A description of your pen thickness changes, including the original and replacement values.**

Take your time, experiment, and please reach out if you need help. I am happy to work through it with you!
