

CIS270A Project 1 Requirements

Name: Christopher Doleshal

Date: 1-17-21

This project is a refresher on the use of RDi and IBM Access Client Solutions.

RDi is required for this project. Information on installing RDi is found in the “RDi” unit.

For some students, this is a quick refresher, for others it will involve more review and using some techniques, such as the Report Designer, that you may not have used before, depending on when you took the first course.

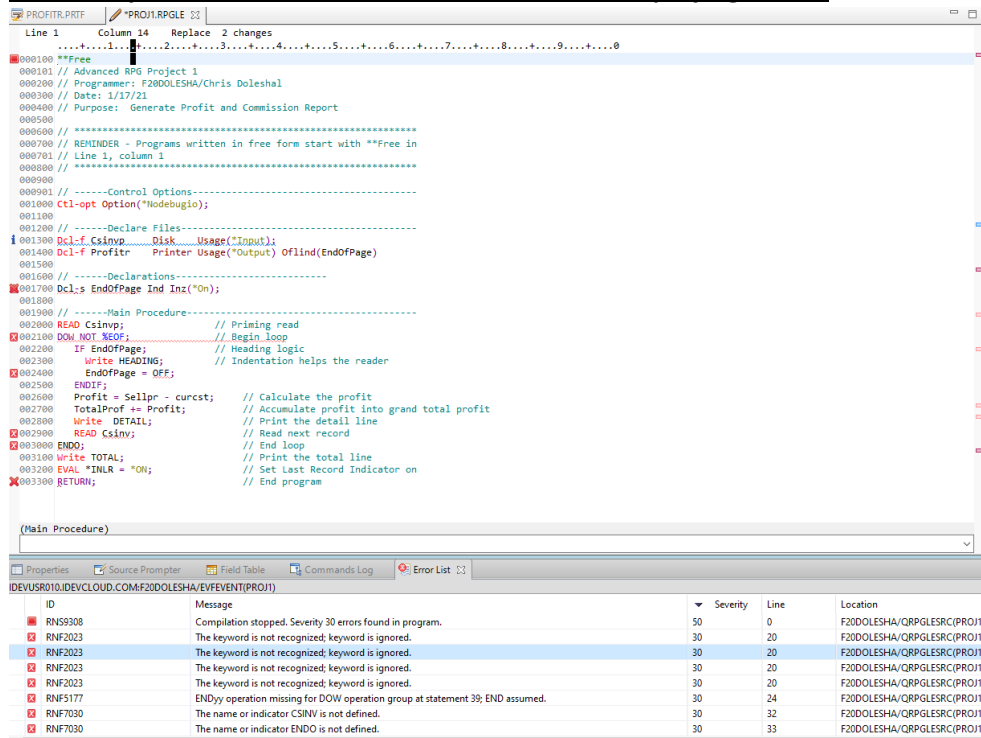

There are two videos in the “RDi” unit that demonstrate the use of RDi for RPG and the use of RDi Report Designer for generating DDS code.

This entire project is to be completed in RDi and IBM ACS. You will be submitting an Excel Spreadsheet and a Word document that contains screen captures. NOTE THAT ALL SCREEN CAPTURES SHOULD SHOW THE ENTIRE RDi WINDOW, INCLUDING THE TITLE BAR.

1. As always, it is important to familiarize yourself with the input data being used in an application. While this can be done using the RUNQRY command in green screen, as you often did in the first course, you can also download the data into an Excel spreadsheet. This video demonstrates how to do this in IBM's Access Client Solutions (ACS) <https://www.screencast.com/t/1cpiRvqG>. Using this method, download the input file into a spreadsheet. The input file is CSINVP, found in the RPGIV_5THS library on the system (this library is on your library list, so you have access to it.) Save this spreadsheet, you will be submitting it as proof you performed this step.
2. Launch RDi and set up your connection if necessary and create the filters as shown in the “Using RDi” video, found in the RDi unit (you might have these from previous installation of RDi).
3. There is a source member named *Profitr* in your QDDSSRC source file. Open this source member in RDi, which will open in Report Designer view, and carefully examine its contents, using both the “Source” and “Design” tabs. Visit the RDi unit for a comprehensive refresher on the RDi Report Designer, or use this brief demo: <https://www.screencast.com/t/YBo3DgWXb>
4. Compile *Profitr* (be sure you are on the “Source” tab so that the compile menu item is available).
5. There is a source member named *Proj1* in your QRPGLSRC source file. Open this source member in RDi and carefully examine its contents. (Note that it contains errors which you will address in the next step) Note that it references the *Profitr* external printer definition and since the calculated fields *Profit* and *TotalProf* are defined on the report, it was not necessary to redefine them in the RPG program; this is a more efficient approach and is more conducive to future maintenance of the code.

6. *Proj1* contains some intentional syntax errors. Open a Word document. Using RDi, find the syntax errors.

- **Screen Capture 1:** Shows a screen shot of the RDi displaying errors.

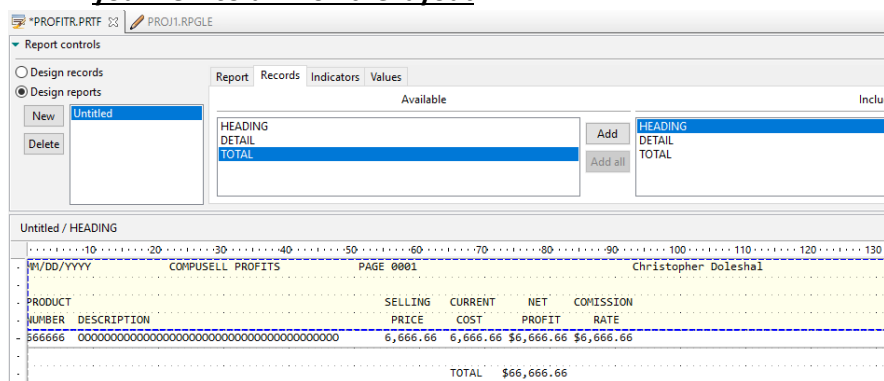

7. **Correct the syntax errors until you have a clean compile. Update the comments at the top of the program. Note that every program you write in this course must begin with this series of comments and that comments should be placed throughout the code as necessary to clarify the processing taking place. Commenting is an important documentation tool and will be evaluated as part of your project grade, with a heavier emphasis than the first course.**

8. Add DCL-C statement for a Named Constant for a commission rate. You decide the value of the rate. You might need to review the Chapter 4 Powerpoint in the “RPG First Course Content” unit.

9. Make the necessary additions in your *Profitr* printer definition and inside the *Proj1* RPG program to calculate and print another column, with appropriate heading and editing, that shows the commission, which is a calculated field, rounded, based on profit multiplied by the commission rate you established in Step 7. Also add your name to the top of the report.

- a. Screen Capture 2: Shows a screen shot of the RDi Report Designer, on the "Design" tab, showing your new column on the layout

- ```
