

CIS270A Project 7

The input file is CSCSTP:

```
/* Customer Master File for CloudServices247
A                               UNIQUE
A      R CUSTREC
A      CUSTNO      6S      COLHDG('CUSTOMER NUMBER')
A      CFNAME      10      COLHDG('FIRST NAME')
A      CLNAME      15      COLHDG('LAST NAME')
A      CSTREET      20      COLHDG('STREET ADDRESS')
A      CCITY      15      COLHDG('CITY')
A      CSTATE      2      COLHDG('STATE')
A      CZIP      9      COLHDG('ZIP + 4')
A      CPHONE      10S      COLHDG('PHONE NUMBER')
A      CALPHONE      10S      COLHDG('ALTERNATE PHONE')
A      CEMAIL      35      COLHDG('EMAIL ADDRESS')
A      ORDDAT      8S 0      TEXT('Last order date')
A      BALDUE      6S 2      TEXT('Balance due')
A      K CUSTNO
```

Most of the data in this file is stored in UPPER CASE. Perform a RUNQRY QRYFILE ((CSCSTP))

Write a program that manipulates the data in the CSCSTP Customer Master File to create various fields.

For each customer, you will print several detail lines containing the new fields. An example output layout is shown below. Design a printchart or just work from this example when coding your output. Be sure all the required items appear on the report in a reasonably well laid out, easy to read format.

This program's logic should sound familiar; much of it is from the first course. **THE OBJECTIVE OF THIS PROJECT IS MODULAR PROGRAMMING / PASSING PARAMETERS.** For EACH of the item's highlighted in yellow below, write a program that will be "called" to perform the function, by passing parameters. Then, write a program that calls each program and uses its returned values to print. **Please name the called/callee programs by the names listed here, and name the calling program PRJ7CALLER. This will help me when evaluating your work.**

3/1/2016 Fun With Modular Programming Page XX0X (this is just a heading line)

Customer: 100001 (this is just the customer number)

User ID: john.doe.100001 (all letters in lowercase, must use concatenation in your solution
Called program name: MAKEID)

Password: jd100001! (must use %Subst and concatenation in your solution; password is
customer's first initial in lower case, last initial in lower case, followed
by the customer number, and then an exclamation point
Called program name: MAKEPASS)

Last Four of Phone: 0523 (must use %Subst in your solution
Called program name: MAKEFOUR)

Send Email Reminder: mm/dd/yyyy (this is the ORDDAT plus 30 days. ORDDAT is not a native date, so in
order to use date arithmetic on it, you will need to make it a native date
first.)
Called program name: MAKEDATE)

Programs:

CALLER/CALLING PROGRAM: PRJ7CALLER

CALLED/CALLEE PROGRAMS:

MAKEID

MAKEPASS

MAKEFOUR

MAKEDATE

Do your housekeeping, leaving only the last good compiles of these along with the generated output report, email when it is ready to be evaluated.
