Assignment Instructions

Bouncing Ball with Sound

Points: 25

Before starting, read this week's textbook assignment and review the associated materials. These will help you understand the example and make the required changes.

This week, you will complete two hands-on projects worth 25 points each. The instructions below are for Part 1.

Create Your Project Page

Create a new page on the student server using the textbook's SoundEffects.html bouncing ball example as your starting point. This project combines this week's audio material with concepts from the past two weeks.

Upload all supporting files, including images and audio, to the correct locations on the server. Check that the file paths in your code match those locations.

Make These Changes

Your page must include the following:

- **Consistent header: Use the same header as your homework home page.**
- **Canvas dimensions: Set the canvas to 800 pixels wide by 400 pixels high.**
- **Ball fill: Choose a color other than green or brown.**
- **Ball outlines: Give each ball a red outline with a line width of 10.**

- **New background music: Select a replacement track from the YouTube Audio Library, upload it to the server, and update your code to use it.**
- **Looping music: Make sure your selected background track repeats.**
- **Music credit: Display the correct song title and a link to its source on your page. Include any additional attribution required for the track.**
- **Navigation: Add a link from this page to your homework home page and a link from your homework home page back to this project.**
-

Test Your Work

Open your published page in a browser and check the animation, sound, appearance, and navigation links. Remember that your browser may require you to interact with the page before audio can begin playing.

Submit Your Project

Submit the URL to your completed project page on the student server through this assignment in Blackboard. Give yourself time to experiment, and please reach out if you get stuck. I am happy to help!
